

THE REGISTRY SIGNAL

CRM Reality Audit

Every parcel in your inventory, checked against the county's recorded documents. Every verdict cites its source.

THE PROBLEM

A land bank's inventory system is a working tool, not a system of record. Statuses get set once and never rechecked; dispositions happen on paper that never makes it back into the database; staff turn over. The gap is invisible until an auditor, a board member, or a buyer finds it — and by then it is expensive.

THE SERVICE

We take your full inventory export and verify every parcel's claimed status — sold, held, listed — against the county's primary public records: recorded conveyances, the assessor's parcel rolls, and the treasurer's tax-sale files. Every parcel receives one of five verdicts:

Verdict	Meaning
SUPPORTED	A recorded county document affirmatively backs your status
CONTRADICTED	The recorded documents conflict with your status as stated
UNSUPPORTED — NO RECORD	No machine-readable county record bears on the claim
AMBIGUOUS	Records exist but neither support nor contradict under the rules
NOT CHECKABLE	The record asserts nothing a county register can confirm

WHAT MAKES IT AUDITABLE

The rules are written down and frozen *before* your data is examined — the verdict vocabulary, the status mappings, the name-matching list, the date windows. They are not adjusted afterward to make results look better or worse. Every verdict cites the specific recorded document (record number, date, parties, retrieval date). Name variants that resemble your organization but aren't on the attested list are never silently matched — they are surfaced verbatim for you to confirm. Absence of a record is reported as exactly that, never dressed up as a conclusion about the world.

What it found, the first time it ran. For a Cook County land bank, we audited an inventory of roughly 700 parcels — just over 400 of them carrying a county-checkable claim. Result: 25 claims where the recorded county documents conflict with the inventory status as stated, 37 more where the records are genuinely ambiguous, and over 150 where no machine-readable county record supports the claim either way. Each finding shipped with its citations, ready for staff to adjudicate. One of the contradictions had already been independently confirmed by a full deed-chain verification before the batch method existed — the batch audit reproduced it exactly.

WHAT YOU RECEIVE

A discrepancy table (spreadsheet + machine-readable), a written audit report with per-parcel citations, and the frozen method document — auditable by your own staff, your auditor, or anyone else. Flagged parcels can be escalated to a full per-parcel dossier: complete deed chain, explicit treatment of conflicting records, and a replay attestation that lets a third party re-derive every number.

ENGAGEMENT

Fixed scope, priced per inventory. Typical turnaround: days, not months. The method runs on public records plus a single inventory export from your system — no integration work required.

This document describes a records-comparison service. It is not a title opinion, not a title search, and not a legal service. Findings state that records agree or disagree; they do not characterize any person or entity. — The Registry Signal, verification for institutions that act on records.
